Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently Amended) A processor comprising:

a cache;

an execution unit to execute an instruction having an operand indicating a monitor address, the instruction being part of a first thread;

a bus controller to assert a ~~preventative~~ signal to allow a modification of a cache line in response to receiving a memory access attempting to gain ~~sufficient~~ ownership of [[a]] the cache line associated with said monitor address ~~to allow a modification of said cache line~~ without generation of another transaction indicative of the modification;

suspend logic responsive to a second instruction in the first thread to suspend the first thread; and

resume logic to resume the first thread.

2. (Original) The processor of claim 1 wherein said cache is an L1 cache and wherein said processor further comprises an L2 cache.

3. (Original) The processor of claim 2 wherein the cache line associated with said monitor address is flushed from the L1 cache and the L2 cache in response to said instruction.

4. (Currently Amended) The processor of claim 1 wherein said bus controller is to generate a bus cycle in response to the instruction, the bus cycle to eliminate ~~any~~ ownership of said cache line by another processor that would allow modification of said cache line without generation of another transaction indicative of modification of the cache line.

5. (Original) The processor of claim 4 wherein said bus cycle is a read and/or invalidating bus cycle.

6. (Original) The processor of claim 5 further comprising a monitor coupled to said bus controller to monitor bus transactions for a transaction indicative of a write to the monitor address, and to signal a monitor event in response to the transaction indicative of the write to the monitor address.

7. (Original) The processor of claim 2 further comprising:

a plurality of write combining buffers between said L1 cache and said L2 cache;

a snoop port for said plurality of write combining buffers;

a monitor coupled to said L1 cache and coupled to the snoop port to monitor memory access cycles from the execution unit and from the snoop port.

8. (Currently Amended) An apparatus comprising:

a bus controller having a plurality of bus cycle information lines;

programmable memory access detection logic coupled to a bus, said programmable memory access detection logic comprising a storage location to store a monitor address specified by an instruction being part of a first thread and comparison logic having inputs coupled to said. storage location and said plurality of bus cycle information lines and a comparison logic output;

~~coherence logic coupled to receive said monitor address, that in response to the instruction is to generate a read and/or invalidate transaction for a cache line associated with said monitor address~~suspend logic responsive to a second instruction in said first thread to suspend said first thread; and

resume logic responsive to said comparison logic output to resume said first thread.

9. (Original) The apparatus of claim 8 wherein said programmable memory access detection logic comprises write detection logic.

10. (Original) The apparatus of claim 9 further comprising:

hit generation logic coupled to said storage location and said bus controller, wherein said hit generation logic has an output hit signal externally available to couple to a system bus.

11. (Original) The apparatus of claim 8 wherein said bus controller is to generate, in response to the instruction, a bus cycle chosen from a set consisting of:

a bus read line invalidate of the cache line associated with said monitor address;

a bus write line invalidate of the cache line associated with said monitor address.

12. (Original) The apparatus of claim 8 wherein said read and/or invalidate transaction is to ensure that no other processor caches include said cache line associated with said monitor address in a modified or exclusive state.

13. (Currently Amended) The apparatus of claim 8 ~~wherein said instruction is a part of a first thread,~~ further comprising~~:~~ coherence logic coupled to receive said monitor address, that in response to the instruction is to generate a read and/or invalidate transaction for a cache line associated with said monitor address.

~~suspend logic responsive to a second instruction in said first thread to suspend said first thread;~~

~~resume logic responsive to said comparison logic output to resume said first thread.~~

14. (Currently Amended) The apparatus of claim ~~13~~ 8 further comprising:

partition/anneal logic to anneal and partition resources responsive to respectively suspension and resumption of said first thread.

15. (Currently Amended) A method comprising:

performing a first bus transaction to eliminate ownership by other agents of a cache line associated with a monitor address specified by an instruction;

asserting a ~~preventative~~ signal to allow a modification of the cache line in response to a second bus transaction attempting to gain ownership of said cache line associated with the monitor address;

suspending execution of a first thread of which the instruction is a part, in response to a second instruction; and

resuming execution of said first thread in response to detection of a memory access to the monitor address.

16. (Currently Amended) The method of claim 15 wherein performing the first bus transaction comprises:

preventing ~~any~~ a system processor cache from storing said cache line associated with said monitor address in a modified or exclusive state.

17. (Original) The method of claim 15 wherein performing the first bus transaction comprises performing an invalidating transaction.

18. (Original) The method of claim 15 wherein performing the first bus transaction comprises performing a read transaction.

19. (Original) The method of claim 15 wherein asserting the preventative signal comprises asserting a hit signal in response to a transaction which could result in a bus agent gaining ownership of the cache line associated with said monitor address.

20. (Original) The method of claim 15 wherein said monitor address is an operand of said instruction.

21. (Original) The method of claim 15 further comprising flushing said cache line from a plurality of processor caches in a processor that executes said instruction.

22. (Cancelled).

23. (Currently Amended) The method of claim ~~22~~ 15 wherein suspending execution of the first thread further comprises:

relinquishing a plurality of thread partitionable resources associated with said first thread.

24. (Currently Amended) A system comprising:

a bus;

a first processor having a first cache; and

a second processor having a second cache, said second processor comprising:

a monitor to monitor transactions from the first processor on the bus to detect a

memory access to a monitor address specified by an instruction executed by said second

processor,;

coherence logic to generate a bus transaction to prevent said first cache from

owning a cache line associated with said monitor address, and

thread suspension logic to suspend a first thread of which said instruction is a part

until an access to said cache line associated with said monitor address occurs.

25. (Original) The system of claim 24 wherein said second processor further comprises:

hit generation logic to generate a hit signal in response to a read transaction to said cache

line associated with said monitor address.

26. (Original) The system of claim 24 wherein said second processor is to flush said

cache line associated with said monitor address from the second cache in response to said

instruction.

27. (Original) The system of claim 24 wherein said bus transaction to prevent said first

cache from owning said cache line associated with said monitor address is a read transaction.

28. (Original) The system of claim 24 wherein said bus transaction prevents the first

cache from holding said cache line associated with said monitor address in a modified or

exclusive state.

29. (Cancelled).

30. (Currently Amended) The system of claim 29 24 wherein said second processor

further comprises partitioning and annealing logic to relinquish resources associated with said

first thread when said first thread is suspended and to re-partition resources to accommodate said

first thread when said first thread is resumed.

31. (New) A method comprising:

performing a first bus transaction to eliminate ownership by other agents of a cache line associated with a monitor address specified by an instruction being part of a first thread of instructions;

attempting to gain ownership of the cache line associated with the monitor address;

suspending execution of the first thread in response to a second instruction; and

resuming execution of the first thread in response to detection of a memory access to the monitor address.

32. (New) The method of claim 31 wherein performing the first bus transaction comprises:

preventing a system processor cache from storing the cache line associated with the monitor address in a modified or exclusive state.

33. (New) The method of claim 31 wherein performing the first bus transaction comprises performing an invalidating transaction.

34. (New) The method of claim 31 wherein performing the first bus transaction comprises performing a read transaction.

35. (New) The method of claim 31 wherein attempting to gain ownership of the cache line comprises asserting a hit signal in response to a transaction configured to cause a bus agent to gain ownership of the cache line associated with the monitor address.

36. (New) The method of claim 31 wherein the monitor address is an operand of the instruction.

37. (New) The method of claim 31 further comprising flushing the cache line from a plurality of processor caches in a processor that executes the instruction.

38. (New) The method of claim 31 wherein suspending execution of the first thread further comprises:

relinquishing a plurality of thread partitionable resources associated with the first thread.
